1 Revision History

Version	Date	Revisions
1.0.0	12/01/2020	First release
1.1.0	06/30/2025	Developer Account section added
1.2.0	12/01/2025	Updated User Permission response
1.2.1	7/8/2026	User endpoints updated
2.0	10/15/2026	Garmin Connect Developer Program updated

2 Getting Started

Support Email: connect-support@developer.garmin.com

2.1 Purpose of the Garmin Connect Developer programs

The Garmin Connect Developer Program supports a broad range of organizations, from individual developers and startups to companies operating on a significant scale. The program enables organizations to build integrations that help users connect their Garmin experience with the products and services that matter most to them.
Access to APIs is limited to server-to-server communication and is not available to end-user devices. APIs are designed for secure transfer of data from Garmin to Licensee servers, and ad hoc requests for data are not permitted. Licensees are responsible for receiving and storing data in a timely manner.

The Licensee's License Key, once issued to Licensee, will not be, shared with, transferred to, disclosed to, or used by any external third party.

Program information, documentation, technical materials, credentials, commercial information, and related communications are confidential.

The Garmin Connect Developer Program offers two levels of access:

1. **Starter Access** – Designed for organizations building and launching Garmin Connect integrations. Starter Access provides access for up to 1,000 connected users, with push-only data delivery, no historical data access, and one client ID per licensee. Applications must comply with Garmin's integration and user experience (UX) requirements.
   Garmin reviews Starter Access implementations for compliance with our terms as your app starts to grow and new user connections may be limited until this review is complete. This review is to protect end customers at this early stage, enabling developers to join and start developing quickly but continuing to preserve our pledge to protect our customers. Please ensure your application has a valid, publicly accessible website, a published privacy policy, and must comply with Garmin's requirements for integrations.
   Apps with Starter Access are marked as unverified because they have not been reviewed by Garmin. Verification is a part of the Enterprise Access onboarding process, where Garmin conducts a review of the app to ensure it meets program requirements.

2. **Enterprise Access** – Designed for organizations operating at scale or requiring capabilities beyond Starter Access. Available APIs, capabilities, scale, and commercial terms are tailored based on business and technical requirements. Enterprise Access supports additional APIs and capabilities, historical data access, multiple client IDs, and unlimited connected users under an applicable commercial agreement.

2.2 Client ID and Client Secret

To gain access to the APIs, please create a client ID and secret. The client ID is used to identify an application uniquely, and the client secret is used to validate that the requests received are from that application and not from a third party that has gained unauthorized access to the client ID. Client ID and client secret cannot be shared with any third party. The client ID can be considered public information, but the secret is private. **For the security of users, developers must never include their client secret in public (mobile or browser-based) clients.**

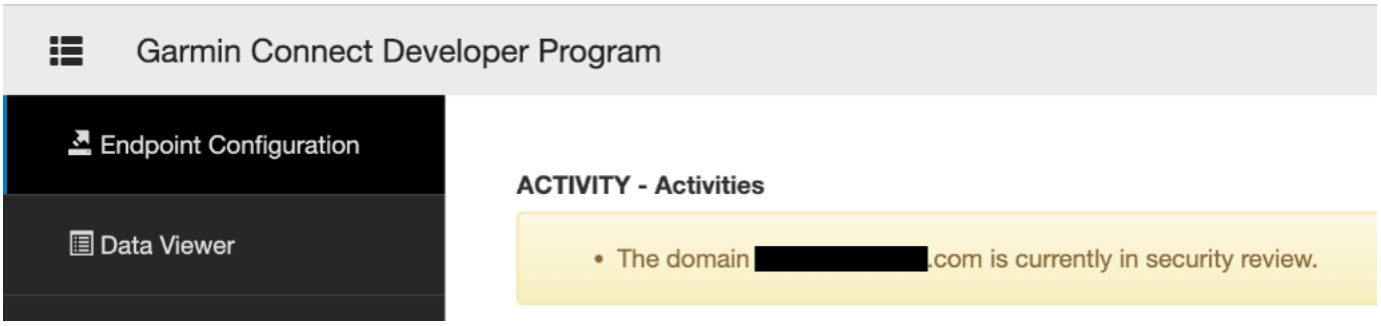

A client ID and secret credentials are created at the Developer Portal via APP tab:
https://developerportal.garmin.com/developer-programs/connect-developer-api

2.3 Endpoint configuration

We are webhook-based APIs, and all data will be delivered to your server via PUSH notifications.
PING/PULL configuration is supported with enterprise level.
You can configure your endpoints at API tools https://apis.garmin.com/tools/endpoints
The PUSH Service allows licensees to receive near-real-time updates of Garmin user data without delay or duplication associated with regularly scheduled update jobs. The Push Service generates HTTPS POSTs that contain the updated data directly within the POST as JSON.

2.4 Security Review

All new domains provided at the API tools are subject to a security review. You may see a warning if a review is triggered. It will clear automatically within 24- 48 hours.

If you are making any changes in production, you can reach out to connect-support@developer.garmin.com to validate new domain beforehand.

3 Developer Account

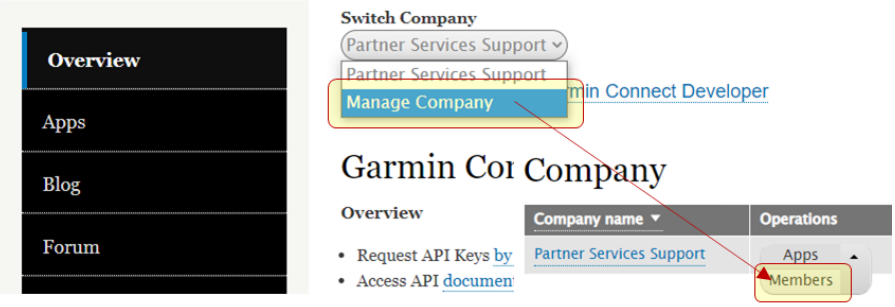

3.1 Team Members and Accesses

All members of your team must be added to the list of verified users at developerportal.garmin.com

Please note the following restrictions:

- **All developers must be added to the developer account. We do not provide support to unverified accounts.**
- As stated in Section 5.2 of the API Agreement, Garmin will not provide support to unverified users. Sharing access, documentation, or app credentials with unverified individuals will result in revocation of your app access without prior notice.

To add Developers/users to the account, log in, click on your company name, and select the "Members" section.

3.2 API Updates: sign-up steps

You may also **sign up for API Update Release Notifications** by going to 'My Account' - Notify Settings - Receive Email - Subscriptions - Blog Entry.

It is highly recommended to sign up for the Blog so that you will be aware of all future API updates.
